

Citrix Cloud Workspaces on Microsoft Azure

Many organisations face the challenge of providing their teams with access to high performance workspaces with the flexibility to respond to business needs. Teams require the tools to be productive anywhere on any device, with access to applications, data, and services in a place and manner of their choosing. These needs must be met whilst also ensuring consistent security for both the user and business data.

Citrix Workspace enables you to **adopt Zero-Trust principles** for the secure delivery of applications, data and services to **any user**, on **any device**, from **anywhere** in the world.

Close integrations between Citrix Cloud and Microsoft Azure enable the use of the global network of Microsoft Azure Regions to deploy your workloads in the best location to deliver optimum performance. Microsoft Azure allows you to **scale your workloads** to support business needs rather than needing to invest in on-premises hardware based on anticipated future needs.

The ability to **right-size** your workloads allows you to deliver the right performance profile for today with the flexibility to adjust for the needs of tomorrow. Combine the power of Citrix Workspace and Microsoft Azure to provide Next-Gen workspace capabilities to your business.

Example deliverables

User workloads can often be one of the first workloads that organisations consider for Microsoft Azure. With extensive experience deploying, managing and supporting Microsoft Azure solutions for our customers, Ultima can guide you through the process of deploying your workloads following the Microsoft Cloud Adoption Framework.

Whether you have no presence in Microsoft Azure, or are already consuming services, Ultima can guide you through:

**Landing Zone design
and leading practices**

**Security and Identity
Management design**

**Operational Support
and Monitoring**

**Networking and Connectivity
design and implementation**
